cluster F's nominal richness signal is a sequencing-depth artifact:
its IgE members were sequenced at ~half their controls' depth (9,685 vs 18,559 reads)
raw counts,
paired Wilcoxon
p = 0.014
rarefied 100×,
paired Wilcoxon
p = 0.041
raw + log₁₀(depth)
covariate (lm)
p = 0.162
